

Bethe Ansatz and Combinatorics

by Atsuo Kuniba

Published on 25 June 2011 from Asakura Publishing Co., Ltd.
(in Japanese, viii+210 pages).

CONTENTS

1. Introduction
 - 1.1. Origin of the problem: Bethe's observation
 - 1.2. Revival after more than half a century: From Russia with I
 - 1.3. Combinatorial inverse scattering: soliton/string correspondence
 - 1.4. $q = 0$: Linearization of Bethe equation
 - 1.5. Origin of integrability: Brief history
 - 1.6. Encoding symmetry: Quantum group
 - 1.7. Controlling paths: Crystal
 - 1.8. Source of ideas: Corner transfer matrix
 - 1.9. Layout of the book
2. Crystal and Combinatorial R
 - 2.1. Crystal
 - 2.2. Young diagram, semistandard tableaux and $U_q(\mathfrak{sl}_{n+1})$ crystal
 - 2.3. Robinson-Schensted-Knuth correspondence
 - 2.4. Crystal of finite dimensional representation of quantum affine Lie algebra
 - 2.4.1. Crystals B_l and B^k
 - 2.4.2. Crystal $B^{k,l}$
 - 2.5. Combinatorial R
 - 2.5.1. Definition and basic property
 - 2.5.2. Algorithm for combinatorial R
 - 2.5.3. Z -invariance
 - 2.5.4. Factorization of combinatorial R
3. Paths and 1-dimensional sums
 - 3.1. Several kinds of paths
 - 3.1.1. Unrestricted path
 - 3.1.2. Classically restricted path
 - 3.1.3. Level restricted path
 - 3.2. 1-dimensional sum for homogeneous path
 - 3.3. Explicit formula for B_1 case
 - 3.4. Representation theoretical meaning
4. Fermionic formula
 - 4.1. Inhomogeneous path
 - 4.2. Energy of path
 - 4.3. 1-dimensional sum
 - 4.4. Kostka-Foulkes polynomial
 - 4.5. Fermionic formula
5. Kerov-Kirillov-Reshetikhin bijection
 - 5.1. Background: Bethe equation and root system
 - 5.2. Rigged configuration
 - 5.3. Bijection ϕ^* and ϕ_* between highest paths and rigged configurations
 - 5.3.1. Deletion and ϕ^*
 - 5.3.2. Addition and ϕ_*
 - 5.3.3. Proof
 - 5.4. Bijection between semistandard tableaux and rigged configurations

- 5.5. Properties of KKR bijection
 - 5.5.1. R invariance
 - 5.5.2. (co)charge and (co)energy
 - 5.5.3. Extension to non-highest paths
 - 5.5.4. Rigged configuration for tensor product
- 6. Ultradiscrete tau function
 - 6.1. Definition by charge
 - 6.2. Piecewise linear formula for KKR map
 - 6.3. Determinants and tau functions
 - 6.4. Proof of ultradiscrete Hirota-Miwa equation
- 7. Soliton cellular automata
 - 7.1. Box-ball system
 - 7.1.1. Takahashi-Satsuma's box-ball system
 - 7.1.2. n color box-ball system
 - 7.2. Formulation by $U_q(\widehat{sl}_{n+1})$ crystal
 - 7.2.1. States and time evolution
 - 7.2.2. Factorization of T_∞
 - 7.3. Symmetry and conserved quantity
 - 7.4. Solitons
 - 7.5. Scattering rule
 - 7.6. Inverse scattering method
 - 7.6.1. Linearization of time evolution
 - 7.6.2. Scattering data and rigged configuration
 - 7.7. Partition function and fermionic formula
 - 7.8. Ultradiscrete tau function and box-ball system
 - 7.8.1. N soliton solution
 - 7.8.2. Analogy with corner transfer matrix
 - 7.8.3. Bilinearization of time evolution
 - 7.9. Variety of soliton cellular automata
 - 7.9.1. Generalization of states and time evolutions
 - 7.9.2. Extension to other affine Lie algebras
 - 7.9.3. Soliton cellular automata with reflecting end
 - 7.9.4. Combinatorial Yang's system
- 8. Periodic box-ball system
 - 8.1. States and time evolution
 - 8.2. Action-angle variables
 - 8.2.1. Action variable and iso-level set
 - 8.2.2. Angle variable and time evolution
 - 8.3. Linearization of time evolution and solution of initial value problem
 - 8.4. Internal symmetry and fundamental cycle
 - 8.5. Tori and their multiplicity
 - 8.6. Relation with Bethe roots at $q = 0$
 - .0. Explicit formula by ultradiscrete Riemann theta function
- Appendix A. Affine Lie algebra, quantized universal enveloping algebra and crystal base
 - A.1. Affine Lie algebra
 - A.2. Root data
 - A.3. Classical subalgebra
 - A.4. Quantized universal enveloping algebra
 - A.5. Crystal base
